

Respondus LockDown Browser & Monitor

You may decide to use this feature on a test because you'd like to mitigate cheating. It is important to understand that this feature has two elements:

1. **LockDown Browser** is a locked browser for taking tests. It will not allow the learner to print, copy, go to another website, or access any other application on their device.
2. You may decide to use the **Monitor** with the LockDown browser but it is not required. This means the learner will need a webcam to take the test. It will record them during the online test. This is an alternative to live proctored tests. It will flag activity like: accessing another device or speaking to another person in the room to detect cheating. You will need to review the videos later for flags.

Please watch the video for an overview:

Note: The settings in the video may look a little different from what you will see in your course. [CLICK HERE](#) to view the Quick Start Guide for step by step setup in D2L. We have a separate training course available to you that will allow you to take a test and see what the process is like for a student. If you'd like to do this in-depth training, please email d2lhelp@msutexas.edu.

Known Issue: Respondus LockDown Browser is NOT compatible with Chromebook Laptops or mobile devices. iPad is the only mobile device that is compatible at this time. If you use either Lockdown or Monitor, students must be told ahead of time to ensure they have access to appropriate technology.
